Top IT stocks stare at great valuation reset

PREMIUM PUZZLE. While Indian IT valuation premium currently ranges from 40-80% over Accenture, the earnings growth outlook lacks the same optimism

Kumar Shankar Roy
Hari Viswanath
bl. research bureau

Welcome to the new guessing game in town, that is, 'Are IT stocks cheap?'. The debate has been raging the last six months and each time it appears cheap enough, another blow knocks it lower. A few weeks back it was Accenture's disappointing outlook that triggered a correction. Last week it was KPIT Tech's negative pre-announcement that saw the stock crash around 25 per cent last week.

After a 30 per cent correction in the Nifty IT index over the past year, the sector's valuation multiples have compressed sharply. On trailing earnings, the index is now around 18 times, a level that looks modest compared with own multi-year averages. On the face of it that sounds like a classic valuation reset. The more uncomfortable question is whether this reset is full, or halfway through.

Look at the Big Four. TCS, Infosys and Wipro now trade around 14-15 times trailing earnings, while HCL Technologies is slightly higher at 18

times Price-to-Earnings (P/E). These numbers look sober when compared with the post Covid boom excesses (broadly 30-40x).

That phase has clearly ended. TCS' P/E has more than halved from a peak of about 42 times to around 15. Ditto for Infosys, which has slipped from about 38 times to 15. Wipro has moved from about 32 times to 14. HCLTech, too, is down from its peak (32x). So, yes, the market has done some cleaning up. The problem is that the cupboard may not yet be fully ship-shape.

This is not a sudden change in stance. *bl.portfolio* has been cautious on Indian IT for about three years, arguing that the sector's post-Covid valuation premium was running ahead of earnings reality. In our February 8 edition, after the latest AI scare hit IT stocks, we had noted that investors should not view corrections as a buy-the-dip opportunity in our article titled 'Lessons for IT investors from AI's iPhone moment'.

The historical comparison is revealing. TCS, Infosys and Wipro are now below their pre-Covid P/E levels. That

Historical P/E trends for Accenture vs major Indian tech stocks

Source: Bloomberg P/E: Trailing price to earnings

gives bulls a decent argument; the froth has gone, businesses remain cash-rich, payout yields are attractive, and any improvement in demand can trigger a sharp rebound.

Bears have an equally simple question: If these companies are no longer growing like premium compounders, why should they be considered cheap?

INCONVENIENT FACTS

In our article titled 'Accenture sets the tone for IT

stocks' (*bl.portfolio* of April 28, 2024), we had explained why Indian IT stocks' valuation cannot decouple from valuation of global IT stocks like Accenture.

Today, Accenture, trading at 10x the trailing P/E, becomes the inconvenient global mirror. A gold standard in IT services and consulting globally, its valuation, earnings expectations and demand commentary matter. In the pre-Covid decade, Accenture used to trade at premium to TCS (which, in turn, used

to trade at a premium to Infosys, HCL Tech and Wipro). Bear in mind that Accenture has significantly outperformed its peers, clocking a 10 per cent USD EPS CAGR for the FY16-26 period, comfortably outpacing the growth rates of HCL Tech, Infosys and TCS (all 6 per cent CAGR), and Wipro (3 per cent CAGR). Even after factoring for currency benefit, the EPS CAGR for Indian peers at 7-9 per cent CAGR is below Accenture.

While Accenture's margins

are lower than TCS, its larger scale and higher revenue share from high-end business used to garner it a premium over Indian IT. Post Covid, the valuation math has changed. Today, the valuation premium of Wipro, Infosys, TCS and HCL Tech at 39 per cent, 46 per cent, 53 per cent and 84 per cent, respectively, appears unjustifiable. This implies whenever IT stocks rebound, Accenture is likely to outperform Indian peers.

The basic issue is simpler: Are Indian IT companies expected to grow materially faster than Accenture? For Accenture, one-year forward consensus PAT growth is about 6 per cent. For TCS, Infosys, and Wipro, the corresponding numbers are 8 per cent, 4.7 per cent, and 9.5 per cent aided by currency depreciation. Now, the premium question becomes less emotional and more arithmetic.

The other inconvenient fact is growth. Stocks are cheap when one looks at the information in the rear-view mirror or against their own historical valuation, but are they cheap when one looks at data in front? With the industry in the midst of a once-

in-a-generation AI disruption, the future growth rate is entirely unpredictable, making any valuation exercise, for now, largely speculative. While a case can be made on the payout ratios with trailing dividend yield, say, for companies like TCS at 5.2 per cent, there may be a situation in future where if companies need to deliver on growth they will have to invest impacting dividends.

In this context, mid-cap IT offers a sharper warning. Even after correction, several names still trade at premium valuations. Persistent, Coforge and Mphasis trade in 30-40x trailing PE band. KPIT Tech's more than 15 per cent single-day fall on July 1 showed what happens when the market starts questioning the extra-growth story. The stock is still trading near 25x. Others like Tata Elxsi trade at 35x even after a 41 per cent correction over last one year.

Has the market already priced in the pain, or is it merely rediscovering that even great companies need growth to deserve great multiples? That is the \$250-billion-dollar (Nifty IT total m-cap) question right now.

CG Semi's Sanand chip facility starts production

Our Bureau
Ahmedabad

More than 75 engineers packed their bags and relocated to Gujarat from the Philippines, South Korea, the US and Malaysia to help build CG Semi's ₹7,500-crore Outsourced Semiconductor Assembly and Test (OSAT) facility at Sanand. On Saturday, Prime Minister Narendra Modi inaugurated the plant, making it only the third semiconductor facility in India to commence commercial production in the past five months.

YOUNG WORKERS

On the shop floor, these engineers now work alongside young women from Chhattisgarh, Jharkhand, Madhya Pradesh, Gujarat, Jammu & Kashmir, and Kerala, many of whom had never stepped outside their villages before

IN ACTION. Prime Minister Narendra Modi inspecting the CG Semi OSAT facility, in Sanand on Saturday @NARENDRAMODI

travelling to Malaysia for specialised semiconductor training. "Over 75 of our colleagues moved to Gujarat from the Philippines, South Korea, the US and Malaysia. They came here not merely to build a factory but to help build India's capability," said Vellayan Subbiah, Chairman of CG Power and Industrial

Solutions Ltd, whose subsidiary CG Semi has developed the facility in partnership with Japan's Renesas Electronics and Thailand's Stars Microelectronics.

For Subbiah, the project's significance lies as much in capability-building as in manufacturing. "It is deeply

symbolic that our first shipment is going to global customer Renesas Electronics, our Japanese partner," he said. "Our partner Renesas taught us what being truly world class means. Their qualification standards were tough. Very tough. By meeting those standards, we not only earned the trust of our customers but also confidence in what advanced Indian manufacturing is capable of achieving," he added.

The chips packaged at the Sanand plant will find their way into automobiles, scooters and industrial equipment before being exported to Japan, the US and Europe, said IT Minister Ashwini Vaishnaw. He also highlighted the workforce behind the facility.

ECOSYSTEM SHAPES UP Spread over 75,000 sq ft, the Sanand facility has the capacity to package about 300

million semiconductor units annually. Right next to it, a second plant spanning nearly one million square feet is already under construction and is expected to increase capacity to four billion units a year.

For Modi, the plant is evidence of a semiconductor ecosystem beginning to take shape. Within months of Micron Technology, Kaynes and now CG Semi commencing commercial production in Sanand, the region is beginning to resemble the manufacturing clusters that transformed countries such as Taiwan, South Korea and China. "Step by step, brick by brick and chip by chip, the Semicon India programme is catching pace," he said, adding that semiconductor clusters eventually attract suppliers of chemicals, testing laboratories, equipment service companies, chip designers and start-ups.

No full runway closure at Srinagar airport, a relief for trade, tourism

Gulzar Bhat
Srinagar

Srinagar International Airport on Saturday announced that there will be no full runway closure this year for repair and maintenance work, a move welcomed by the tourism and business sectors.

Chief Minister Omar Abdullah thanked the Centre for withdrawing the proposed closure, saying it would spare travellers and the tourism industry significant disruption during the peak tourist season.

In a post on X, the airport said there would be no full runway closure in 2026.

"Airport operations will continue daily from 8 am to 5 pm. Night closures for runway maintenance work will continue until October," it

said. The airport also said the previously proposed Notice to Airmen (NOTAM), which envisaged full runway closures on Mondays and Tuesdays, has been withdrawn.

Airlines will continue operating scheduled flights and revise their schedules in line with the updated operating hours.

TRAVELLERS RELIEVED

In a separate post on X, Abdullah thanked Defence Minister Rajnath Singh and Civil Aviation Minister Kinjarapu Ram Mohan Naidu for accepting the Jammu and Kashmir government's request to drop the airport closure plan.

"The proposed closure would have caused significant inconvenience to regular travellers and forced tour groups and tourists to cancel

their planned visits," the Chief Minister said.

The Kashmir Economic Alliance (KEA), an umbrella body representing traders, transporters and other business stakeholders, also welcomed the decision to withdraw the proposed airfield closure and maintain uninterrupted daytime flight operations.

KEA spokesperson Qazi Tauseef told *businessline* that the decision came as a major relief for Jammu and Kashmir's trade, tourism and business sectors, which would have been severely affected by prolonged disruption to air connectivity.

"The withdrawal of the closure plan will help sustain tourist arrivals, business travel and the movement of perishable goods, all of which are crucial to the region's economy," he said.

FPIs turn net buyers, pump in ₹16,461 cr this week

Anupama Ghosh
Mumbai

Foreign portfolio investors (FPIs) turned net buyers in Indian markets during the week ended July 3, pumping in a net ₹16,461.84 crore across equity, debt and hybrid instruments over all five trading sessions, according to data from the National Securities Depository Limited (NSDL).

The week, which began with the final two sessions of June before transitioning into July, saw net inflows on each trading day.

FPIs recorded their highest single-session investment of the week on June 29 at ₹5,986.33 crore, followed by ₹4,334.95 crore on June 30. In July, net inflows stood at ₹552.98 crore on July 1, ₹2,608.01 crore on July 2 and ₹3,000.90 crore on July 3.

MODEST NET INFLOW

The strong weekly perform-

ance contrasts with the broader trend in June, when FPIs remained net sellers in equities. During the month, they pulled out ₹49,340.45 crore from equities through stock exchanges and the primary market combined.

However, debt markets attracted robust flows, with FPIs investing ₹30,620.28 crore under the General Limit, ₹21,652.09 crore through the Fully Accessible Route (FAR), and ₹3,246.04 crore under the Voluntary Retention Route (VRR).

Overall, June ended with a net FPI inflow of ₹4,668.86 crore across all asset classes.

STEEP YTD OUTFLOWS

"The highlight of the June FPI activity is the significant tapering of FPI selling and their buying for a few days towards the end of June," said VK Vijayakumar, Chief Investment Strategist at Geojit Investments Limited.

"Going forward, FPI out-

flows are likely to decline."

Despite the recent buying, FPIs remained heavy net sellers in 2026. As of July 3, cumulative net outflows across all asset classes stood at ₹2,12,872.28 crore.

Equities bore the brunt of the selling, with net outflows of ₹2,74,272.90 crore through the secondary and primary markets combined.

"The total FPI selling for 2026 till the end of June stands at ₹2,94,387 crore through stock exchanges," Vijayakumar said. "Since FPIs invested ₹20,114 crore through the primary market, the net FPI outflow this year through June-end stood at ₹2,74,272 crore."

CRUDE, RE AND RAINS

Market participants are now tracking a mix of domestic and global factors that could determine the direction of FPI flows in the coming weeks. Vijayakumar identified crude oil prices and rupee stability as key variables.

"A crash in crude prices to below \$72/barrel and the large inflows expected from FCNR(B) deposits will significantly reduce India's balance of payments deficit," he said. "This will help the rupee stabilise and even appreciate, which, in turn, will prevent large FPI selling."

Analysts also expect institutional flows to remain sensitive to the progress of the monsoon, given its implications for rural demand and inflation, as well as the unfolding Q1FY27 earnings season. Global cues, including developments in US-Iran negotiations, crude oil prices and the minutes of the US Federal Reserve's June policy meeting will also shape investor sentiment.

"The weakening of the chip trade globally, and the significant correction in the Kospi, in particular, may even persuade FPIs to turn buyers in India," Vijayakumar added.

E20 vehicles safe for higher blends too, but fuel efficiency may drop, say auto-makers

Prabhudatta Mishra
New Delhi

Amid a social media backlash over the rollout of 20 per cent ethanol-blended petrol (E20), the government on Saturday nudged the automobile industry to address public concerns. Representatives of major automakers subsequently held a media briefing at Delhi's National Media Centre, defending E20 as safe for vehicles though it may lead to a marginal drop in fuel efficiency.

Maruti Suzuki's Rahul Bharti said E20-compliant vehicles manufactured since 2023 are engineered to tolerate ethanol blends higher than 20 per cent, although he declined to specify the upper limit.

The Automotive Research Association of India (ARAI), under the Ministry of Heavy Industries, is currently evalu-

ating E22 and E25 blends and is expected to submit a report to the Petroleum Ministry by December.

HIGHER BLENDS

"Internally, we have a much higher factor of safety. We are absolutely comfortable if the blending goes up by some percentage points from the current E20 level. As of now, we have not taken a call on what that level is because there are several variables relating to design, production and usage. But when we certify an E20-compatible car, it is actually compatible with

much higher blends," Bharti said.

Bharti also said E20 reduces fuel efficiency by 3-3.5 per cent because of ethanol's lower energy content.

BUILT-IN SAFETY

Vikram Gulati, Country Head and Executive Vice-President (Corporate Affairs), Toyota Kirloskar Motor, echoed the view, saying there is a built-in safety buffer beyond E20. Referring to the transition from E10 to E20, he said independent testing by ARAI had shown no adverse impact on vehicles. However, Gulati clarified that Toyota has not independently tested blends higher than E20.

Puneet Anand, Associate Vice-President of Hyundai Motor India, said the industry itself would raise the issue with the government if customers faced genuine problems.

The automakers stressed

that E20 was introduced after extensive scientific validation and meets stringent fuel quality standards. They maintained that it is safe even for vehicles manufactured before 2023.

YEARS OF EVALUATION

Vartika Shukla of Engineers India said the E20 programme was the result of years of scientific evaluation, not a sudden policy decision. India increased ethanol blending in petrol from about 1.5 per cent in 2013-14 to 20 per cent by December 2025, achieving the target five years ahead of schedule. The Ethanol Blended Petrol (EBP) programme was backed by extensive testing by automakers, ARAI and the Society of Indian Automobile Manufacturers (SIAM), and aligns with practices followed in the US, Brazil, Canada and Germany.

WISE WORDS.

“Recognizing that valuations matter profoundly over the long run, yet are nearly useless over the short run, is central to navigating complete market cycles

JOHN P HUSSMAN
President, Hussman Investment Trust

MARKET ACTION.

SENSEX

NIFTY

Clouded under El Nino skies

RAIN OR SHINE?

With the El Nino event confirmed by several global weather agencies, the fear seems real now. Here's a look at how it could impact agriculture, allied sectors and markets, should there be a weak monsoon this year

Nalinakanthi V

Come May, one event that is most-awaited and tracked by India Inc and investors is the onset of the South-West monsoon and its progression.

The 2026 South-West monsoon season has opened on a weak note, with the country recording a 40 per cent deficient rainfall in June. However, the IMD expects monsoon to progress, beginning this week.

One word that is frequently making the headlines is El Nino. And with several global weather agencies having confirmed the event, the fear seems real now. But is El Nino something investors should really worry about?

For those who are unfamiliar with the Spanish word, it basically denotes the adverse changes (rapid increase) in the sea-surface temperature (SST) over central and eastern Pacific region. This affects the trade wind formation and movement, eventually resulting in below-normal rainfall in Australia and South-East Asian regions such as Indonesia and also has an impact on India's monsoon rainfall.

But an El Nino event does not necessarily spell doom. Much depends on its timing. If conditions intensify only after September, the impact on India is likely to be limited, as the South-West monsoon accounts for nearly two-thirds of the country's annual rainfall.

The intensity of the El Nino event is very crucial. The Nino 3.4 Index, in addition to trade winds, atmospheric response and sub-surface ocean temperatures, is the basis for ascertaining the event. If the SST value is above 0.5 for five consecutive three-month overlapping seasons, then it's a weak El Nino. An SST value between 0.5 and 1.5 implies a moderate El Nino; while any value above 1.5 indicates a stronger event.

We have had two El Nino episodes in the last three decades — 2015 and 2023. But in 2015, which is considered moderate El Nino, the overall rainfall deficit was 12.7 of the Long period Average (LPA). Interestingly, in 2009, which was a drought year, the SST values during the season were under 0.5, indicating a no El Nino year. Likewise, 2014, too, was not an El Nino year.

It is clear that El Nino is not the only reason for a poor monsoon. Indian Ocean Dipole (IOD) is a climate phenomenon caused by variations in sea temperatures in the Indian Ocean. Its positive, negative and neutral phases can influence the Indian monsoon. A positive IOD brings good rainfall to India, while a negative IOD results in lower seasonal rainfall.

Other factors include Madden Julien Oscillation (MJO), more of a short-term phenomenon lasting for about 60 days, unlike an IOD or El Nino, which last for several months.

What is the current status of El Nino, IOD and MJO, and what are the implications for our South-West monsoon season?

As per SST data published by the IMD, the SST value was -0.1 for the March-May period, which is an increase from -0.9 in the December-February period. However, as per the latest data released by Columbia Climate school, the SST anomaly measured using Nino 3.4 Index, which was at 0.48 degree Celsius in March-May period, has increased swiftly to 0.94 degree Celsius by May and further increased to 1.7 by June 17. This indicates a strong possibility of a moderate-to-severe El Nino event this season. Multiple agencies, including National Oceanic and Atmospheric Administration, have confirmed the El Nino event.

The IOD, which was positive to neutral at the start of the year, is now showing a swing towards negative zone — with the May IOD at -0.39 in the IMD website. MJO is possibly not presenting clear indications yet.

However, the IMD has indicated widespread rainfall this week, supported by formation of a 'low'. While the rainfall progress in July remains extremely crucial, the Indian government has launched an emergency plan to protect crops in 315 districts with irrigation infrastructure gaps and significant deficiency in rainfall and the farming community is preparing itself for the worst. The government is helping the farming community to navigate this phase by shifting to crops, such as millets and pulses, which can thrive on less water, use of climate-resistant and short-duration crops, etc.

Efforts such as these can help minimise the impact of weak rainfall on farm incomes, as food-grain production bears the biggest brunt of a weak-rainfall season. Directionally, the impact is

visible, either through flattish output or a marginal decline in output during the years when the monsoon has been below normal. For instance, in 2009-10, which followed the 2009 drought year, foodgrain production slipped 7 per cent. In the following years — 2014 and 2015 — production was lower by 4.9 per cent and 0.2 per cent, respectively. Similarly, in 2019, when the rainfall was a tad lower, the growth in foodgrain production was flat. As foodgrain production is highly sensitive to monsoon rainfall, this needs to be closely monitored. Meaningful improvement in rainfall will be crucial to keeping food inflation under check.

Levels of farm income and food inflation are two important variables that have a bearing on economy and interest rates and thereby on the markets.

However, India has, over the last three decades, managed to increase the area under irrigation — from 33.6 per cent in 1990-91 to 39 per cent by 2001 and 59 per cent by 2023, is worth noting. States such as Punjab and Tamil Nadu have seen significant improvement in the irrigation penetration, while Maharashtra continues to be significantly dependent on the monsoon, making it more vulnerable, given that the State is a key producer of sugarcane and cotton.

SECTORS THAT NEED TO BE WATCHED

While conventional wisdom suggests that agri and allied sectors may be the first casualty of a weak monsoon, what does historical data point to?

Contrary to our conventional wisdom that monsoon weakness may have a direct and significant impact on the sales of agri-inputs, historical data show resilience. For instance, when we study the trend in fertilizer sales, it has remained strong even during weak monsoon years. For instance, during the drought year of 2009, fertilizer consumption grew 6.4 per cent year-on-year. Similarly, in 2014 and 2015, when the rainfall was lower than the LPA by 12 per cent and 14 per cent, respectively, fertilizer sales grew 4.5 per cent and 4.3 per cent, respectively. This is largely because of two reasons. First, the purchases typically happen ahead of the season and hence remain unaffected by the rainfall. Second, the high government subsidy on urea and complex fertilizers has also supported consumption. Stocks such as Chambal Fertilisers and Chemicals, and Coromandel International have delivered healthy gains irrespective of the monsoon concerns and stocks are up 9-10x in the last 12 years.

Interestingly, the sector has seen significant improvement in profitability over the last decade, thanks to the initiatives to bring in operational efficiencies. This aside, government efforts such as direct benefit transfer for subsidy and timely payment of subsidies, have helped improve the sector's balance sheet.

Chambal Fertilisers, a leading producer of urea, for which the subsidy continues to account for a significant portion of the total realisation, has seen its debtor-days reduce from 100+ levels

Monsoon trend over the years

Rainfall (% of LPA)

in FY15 to less than a week in FY24 and FY25, although it has increased to about a month in 2026. For Coromandel International, among the country's largest complex fertilizer players, debtor-days halved from over 40 days in FY15 to about 20 days by FY24. However, FY26 has seen an increase in the debtor-days.

Even as the broader demand is expected to remain steady in 2026-27, the significant jump in

Higher irrigation penetration has helped

% of net irrigated area to net sown area

Foodgrain production: has managed to keep pace with the demand

Total food grain production in million tonnes

Fertilizer consumption in nutrient terms - NPK has remained resilient

in million tonnes

Inflation plays a catch up

CPI of food and beverages (%)

input costs for the sector due to the US-Iran war could result in an increase in the working capital needs for companies and impact profitability. The reason: Even though the government continues to shoulder the burden of higher input costs through subsidy, payment can be back-ended as the subsidy for complex fertilizers were announced ahead of the crude rally.

Sulphur, a crude derivative used to make phosphoric acid, which in turn is used in complex fertilizers, has risen from \$350 per tonne in 2025 to almost \$850 per tonne in 2026. The cost of anhydrous ammonia has also increased from \$500 a tonne last year to over \$750 this year. Gas prices globally witnessed sharp rise in 2026 due to the war.

Agrochemicals has traditionally seen some correlation to monsoon rainfall. This is because, unlike fertilizers, only the purchase of preventive sprays happen ahead of the monsoon. For instance, in 2014 and 2015, when the country saw two consecutive years of deficient rainfall, the overall industry witnessed growth stagnation at about ₹20,000 crore. However, they staged strong recovery post 2015. For an industry that was reeling under pressure due to global de-stocking and price-cuts driven by China since 2023, the de-stocking completion came as a hope. However, the input price hike due to the US-Iran war may play spoilsport in the short term.

Besides impact on the sectors that are directly connected with agriculture, a weak monsoon may have a cascading effect on other sectors, too, like FMCG companies.

BENEFICIARIES

However, there are some sectors that cheer a weak monsoon. Construction and building materials sectors, for instance, always share an inverse relationship with the South-West monsoon. A poor monsoon rainfall means uninterrupted construction activity and consequently, there is stronger demand for materials such as cement, steel, paints, etc. Cement dispatch, for instance, grew at a healthy 8 per cent plus in 2009, even as the country was grappling with drought. While the sector's prospects are more closely aligned with the overall economic activity, uninterrupted construction during monsoon can boost sales.

Mining is another industry which benefits from a weak monsoon season. Traditionally, mining activity remains lull during monsoon and in the absence of rainfall, mining continues to remain steady, thereby helping companies in this space achieve higher revenue and earnings.

Power generation – coal and also solar – which could be disrupted during the monsoon season, may see higher output, should rainfall not pan out as expected.

FARM INCOME

Sectors riding the rural consumption wave may see an indirect impact from weak monsoon rainfall. Two-wheeler producers and farm equipment makers have traditionally seen tepid sales

Agrochemicals bear the brunt of weak monsoon

Nifty 50 immune to El Nino effect

in years of lower agricultural output. For instance, M&M saw its revenue and operating profit decline 3 per cent and 13 per cent, respectively in FY15.

Another sector that has had a reversal of fortunes over the past decade is FMCG. Within the FMCG universe, the fortunes of the companies that get a significant share of revenues from the rural market, share a strong correlation with the monsoon rainfalls, with a lag effect though. Sample this: Hindustan Unilever's revenue and operating profit declined 13 per cent and 4 per cent respectively, in FY10, following the drought in 2009. In 2014-15, after two consecutive weak monsoons, the company reported flat revenues and a 4 per cent operating profit decline in FY16.

P&G Hygiene and Healthcare saw the weakness continue until 2017 at the revenue level, even as its operating profit margin witnessed improvement during this period. Dabur and Marico also saw their revenue growth stagnate in the FY15-17 period. The stagnation in revenue and profit happened with a two-year lag in FY17-18 after weak monsoons for five consecutive years. The FMCG sector, measured by the Nifty FMCG Index, also mirrored the weak growth of the companies in this space, declining 13 per cent and 5 per cent in 2002 and 2004, and a flat performance in 2015.

Initiatives such as crop rotation and planting of crops that can be managed with limited water can only help partially mitigate the impact of weak monsoon on rural income.

MONSOON AND INFLATION

The effect of a weak monsoon on the food and beverage (F&B) consumer price inflation (CPI) is evident, though with a one-year lag. For instance, after two consecutive weak monsoon phases in 2014 and 2015, monthly CPI on F&B remained elevated at over 5 per cent during 2015-16.

Likewise, after the weak 2023 monsoon, the F&B monthly CPI shot up to a new high of over 10 per cent in 2024 and remained high until 2025.

Another important agricultural product to be monitored is sugar. A sharp spike in sugar can have a cascading effect on packaged foods, FMCG, beverages, etc and can also have a rub-off impact on inflation. The implications are significant with India contemplating curbs on sugar exports in order to meet the country's energy needs, given the focus on ethanol blending programme (EBP), especially due to the spurt in crude oil prices. With sugarcane diversion to ethanol expected to increase, any reduction in cane acreage or yield can risk not only the country's domestic sugar availability, but its ambitious EBP too. Cane acreage and yield are important variables to track.

MONSOON AND MARKET

India's equity indices have historically remained unaffected by the monsoon vagaries. Key benchmark Nifty 50 Index's performance over the weak monsoon phases such as 2004, 2009 and 2023 has remained strong and resilient. Except for calendar year 2015, when the Nifty 50 index corrected about 4 per cent, the benchmark index had actually delivered positive returns during the earlier periods of weak monsoon such as 2002 (3.6 per cent), 2004 (9 per cent), 2009 (71 per cent) and 2023 (30 per cent). Index composition, with significant weightage for banks, financial services, IT services, oil & gas, and metals, is also possibly the key reason behind the resilience. However, the stellar rally in 2009 was after the mayhem in 2008, following the global financial crisis.

Overall, history indicates the impact of El Nino weak monsoon on markets is not broad-based and only affects few sectors. At the same time, there are a few risks now which are different from the past. The impact of inflation arising from reduction in agri produce and the risk to consumption due to fall in rural incomes, can add to the pressure on an already volatile market grappling for positive news.

Even though historical data do not point to any serious risks from a weak monsoon as a standalone factor, the current geopolitical situation and crude price volatility and the weakening of Indian rupee against the US dollar need to be tracked by investors from here. One cannot rule out the possibility of a knee-jerk reaction in the market should the rainfall situation continue to remain weak without any significant meaningful improvement in July and August.

Dhuraivel Gunasekaran
bl. research bureau

In India's vibrant growth story, equities often steal the limelight as the undisputed engine of wealth. They are the go-to for beating inflation and turning dreams into capital. Yet, if the last two years' market rhythms have taught us anything, it is that the road to prosperity is rarely a straight line. It is a journey shaped by economic shifts and sudden global ripples.

Relying solely on equities is like steering a ship with only a sail and no keel. This is where the often-underestimated debt mutual fund steps in. Far from a mere "parking spot" for idle cash, debt is the strategic backbone of a resilient portfolio. Think of it as your portfolio's anchor. While equities provide the speed, debt offers the stability and liquidity required to stay the course.

When market volatility spikes and panic sets in, your debt allocation acts as a vital shock absorber. It tempers the noise, keeps you grounded, and, most importantly, provides the dry powder needed to rebalance when opportunities arise. In the dance of investing, you need the equity sprint paired with the steady rhythm of debt to ensure you reach your destination with your strategy intact.

COMMON CONCERNS

Past credit events that impacted the returns of a handful of debt schemes have discouraged many investors. However, those episodes were largely concentrated in funds that took elevated credit risk. Since then, SEBI has tightened regulations through stricter investment norms, mandatory stress-testing and the introduction of side-pocketing, making such events less likely. The takeaway is not to avoid debt funds, but to choose categories that match your investment goals and risk appetite.

Another argument often raised is that investors can simply invest in hybrid funds instead of maintaining separate debt fund allocations. Hybrid funds certainly offer the convenience of combining equity and debt within a single product. However, they cannot fully replace standalone debt funds. Investors have limited control over the debt allocation and maturity profile within hybrid funds. Separate debt funds allow investors to align investments with specific goals, match duration with investment horizons and rebalance portfolios more effectively. They also provide greater flexibility to create different debt buckets for different financial objectives.

While SIPs are commonly associated with equity funds, they can be equally useful in debt mutual funds. Though less volatile than equities, debt funds also go through periods of rising and falling interest rates, causing their NAVs to fluctuate. A SIP helps in-

A long-term portfolio essential

ASSET ALLOCATION. Balance your equity highs with the steady, reliable power of debt to secure long-term prosperity

DATE WITH DEBT

- Gilt funds offer sovereign security backing
- Short-duration funds balance yield risk
- Corporate bonds target high-rated issuers
- Banking funds combine quality and liquidity

vestors average their purchase cost across interest-rate cycles, making it an efficient tool for salaried investors building a long-term debt allocation.

Among the various debt fund categories, four stand out as suitable core holdings for long-term portfolios.

GILT FUNDS

Gilt funds invest exclusively in government securities issued by the Central and State governments. Since these securities carry sovereign backing, they are virtually free from credit risk. This makes gilt funds one of the safest debt fund categories from a credit quality perspective.

However, gilt funds are highly sensitive to interest rate movements because they typically invest in long-duration government securities. When interest rates decline, bond prices rise sharply, enabling gilt funds to generate significant capital appreciation. Conversely, rising interest rates can temporarily impact returns.

Gilt funds are further divided into dynamically-managed gilt funds and gilt funds with a constant 10-year duration.

Interestingly, the volatility in returns is considerably reduced when debt funds including gilt funds are held over longer investment horizons (see chart). A compilation of 10-year rolling returns based on the last 15 years of NAV history shows that gilt funds, including both sub-categories, delivered an average CAGR of 7.7 per cent, with rolling returns ranging between 6.6 per cent and 9 per cent (regular plans considered). As of May 2026, the portfolio yield to maturity

Return volatility declines with longer holding periods

How major debt fund categories fared over longer timeframes

(YTM), which indicates the expected return if the underlying securities are held till maturity and repayments are received as scheduled, ranged between 6.4 per cent and 7.7 per cent across the category.

SHORT-DURATION FUNDS

Short-duration funds invest in debt securities with Macaulay duration ranging between one and three years.

In simple terms, Macaulay duration refers to the average time a debt fund takes to recover the money invested.

These funds strike a balance between generating higher yields than liquid categories while avoiding the significant interest rate risk associated with long-duration funds.

Because of their relatively shorter maturity profile, they experience lower volatility from changing interest rates. Even if yields rise temporarily, portfolio turnover allows fund managers to gradually reinvest in higher-yielding securities, helping returns stabilise over time.

Short-duration funds are particularly suitable for investors

who prefer relatively-stable returns without taking meaningful duration calls.

Fund managers have the flexibility to invest a portion of the portfolio in AA-rated debt papers. Investors should therefore review the portfolio quality of individual schemes and choose funds that suit their risk appetite.

A compilation of 10-year rolling returns based on the last 15 years of NAV history shows that short-duration funds delivered an average CAGR of 7 per cent, with rolling returns ranging between 6.4 per cent and 7.8 per

cent. As of May 2026, the portfolio YTM for the category ranged between 6.9 per cent and 8.1 per cent.

CORPORATE BOND FUNDS

Corporate bond funds are mandated to invest at least 80 per cent of their assets in the highest-rated corporate debt securities, predominantly AAA and AA+ rated instruments. This significantly reduces credit risk compared with categories that invest across the credit spectrum.

These funds generally offer yields that are moderately higher

than government securities because investors receive additional compensation for lending to financially strong corporate issuers. At the same time, the emphasis on high-quality issuers ensures that credit quality remains robust.

For long-term investors seeking relatively stable income without taking substantial credit risk, corporate bond funds represent one of the most suitable choices.

These funds are particularly suitable for investors who wish to earn better yields than government securities while remaining invested in the highest-quality segment of the corporate bond market. While most schemes predominantly hold the highest-rated securities, fund managers also have the flexibility to invest a small portion of the portfolio in AA-rated papers.

A compilation of 10-year rolling returns based on the last 15 years of NAV history shows that corporate bond funds delivered an average CAGR of 7.4 per cent, with rolling returns ranging between 6.2 per cent and 8.2 per cent. As of May 2026, the portfolio YTM for the category ranged between 7.1 per cent and 8 per cent.

BANKING & PSU DEBT FUNDS

Banking & PSU debt funds invest predominantly in debt instruments issued by banks, public sector undertakings, public financial institutions and municipal bodies. Regulations require at least 80 per cent of the portfolio to be invested in these issuers.

The category has become increasingly popular because it combines relatively-high credit quality with attractive liquidity. Most issuers belong to institutions with strong financial standing or government ownership, reducing the probability of credit events.

Banking & PSU debt funds generally maintain moderate duration profiles, making them less volatile than long-duration categories while still benefiting from favourable interest rate movements. Their balanced risk characteristics make them suitable for investors seeking consistency rather than aggressive duration bets.

For long-term asset allocation, Banking & PSU debt funds provide a compelling combination of credit quality, liquidity and relatively-stable income generation. They can comfortably serve as the core debt allocation for investors looking for dependable performance across interest rate cycles.

A compilation of 10-year rolling returns based on the last 15 years of NAV history shows that Banking & PSU debt funds delivered an average CAGR of 7.4 per cent, with rolling returns ranging between 6.8 per cent and 8.1 per cent. As of May 2026, the portfolio YTM for the category ranged between 7 per cent and 7.9 per cent.

Placing a stop-loss effectively

The right exit point depends on market structure, not emotion

Akhil Nallamuthu
bl. research bureau

● MAKE SURE

The most dangerous mistake is not using a stop-loss at all

A stop-loss is one of the simplest risk-management tools available to investors and traders. At its core, it is a pre-decided exit point — the level at which you accept that a trade is not behaving as expected and exit rather than hold on in the hope that the trend will eventually turn in your favour.

However, a stop-loss should not be a random number. It should ideally be linked to the reason you entered the position in the first place. Broadly, stop-losses can be based on three factors: price action, volatility and time.

TECHNICAL-BASED

This is the most common method among traders, where support and resistance levels on the chart are taken as reference points.

Suppose a stock has rebounded from ₹100 on multiple occasions.

This suggests strong buying interest at that level, making ₹100 an important support. If the stock approaches this level again, traders may expect buyers to step in and prevent a deeper decline.

In such a case, an investor who is bullish on the stock may initiate a long position and place a stop-loss slightly below the support level, say at ₹95, allowing some room

for normal market fluctuations. Similarly, stop-losses can be placed below swing lows, trendlines, moving averages or key chart patterns. Since these methods are based on market structure, they often provide more meaningful exit points.

VOLATILITY-BASED

Markets do not move with the same intensity at all times. During some periods, prices can swing sharply, while at others they may move within a narrow range. Volatility-based stop-losses adjust to these changing conditions.

One popular tool is the Average True Range (ATR), which measures the average price movement over a given period. Suppose a stock trading at ₹2,000 has a 14-day ATR of ₹50. A trader using a stop-loss of two times the ATR may place it about ₹100 below the entry price, around ₹1,900. To avoid obvious levels, some may place it at ₹1,880 or ₹1,885 instead.

Other volatility-based tools include Bollinger Bands, Donchian Channels etc.

Investors can also factor in a stock's beta. For instance, if a stock has a beta of

2 relative to the Nifty 50 and the benchmark is expected to decline by 2 per cent, the stock could potentially fall about 4 per cent. In such cases, a stop-loss that is too tight may result in premature exits.

TIME-BASED

Time-based stops are less common and are generally used in specific situations.

One example is options trading. Suppose a trader purchases a call option for ₹10,000. If the premium paid falls within the trader's pre-defined risk limits, he or she may choose to hold the posi-

tion until expiry. In the worst-case scenario, the option could expire worthless, resulting in the loss of the premium paid.

Time-based exits can also be useful in event-driven trades. For instance, a trader may buy a stock ahead of earnings, expecting strong results. Even if the company delivers the expected numbers, the stock may fail to react positively. In such cases, the original catalyst has played out and exiting the position may be prudent.

That said, time-based stops are often less precise than technical- or volatility-

based approaches and are generally better suited to specific strategies.

COMMON MISTAKES

The most dangerous mistake is not using a stop-loss at all. Many large trading losses occur because participants continue to hold losing positions in the hope of a recovery.

Another common error is moving the stop-loss further away as the price approaches it. This often turns a manageable loss into a much larger one.

Investors should also avoid determining stop-losses solely based on how much money they are willing to lose. The stop-loss should ideally be based on market structure. If the resulting risk exceeds one's comfort level, the solution is not to move the stop-loss closer, but to reduce the position size.

Finally, avoid placing stops at obvious round numbers. Such levels tend to attract large clusters of orders

and may be briefly breached before the trend resumes, resulting in unnecessary exits.

A useful rule of thumb is that a stop-loss should indicate when your investment or trading thesis is wrong, not merely the amount of money you are comfortable losing.

The long game in IPO investing

Dhuraivel Gunasekaran
bl, research bureau

Investing in newly-listed companies can give investors early access to businesses with the potential for strong long-term growth. However, capturing these opportunities is not easy for retail investors. Identifying fundamentally-sound companies, securing allotment in often oversubscribed IPOs and staying invested through the inevitable volatility can be challenging.

The Edelweiss Recently Listed IPO Fund (ERLIF) seeks to address these challenges by investing in a curated portfolio of recently-listed companies through disciplined stock selection and long-term portfolio construction. Launched as the close-ended Edelweiss Maiden Opportunities Fund - Series 1 in 2018, the scheme was converted into an open-ended fund and re-named in June 2021. Over the last seven years, it has delivered a compounded annual growth rate (CAGR) of 19 per cent compared with 14 per cent for the Nifty 500 Total Return Index.

LONG-TERM INVESTMENT

Instead of seeking quick listing gains, the fund focuses on identifying businesses with the potential to emerge as long-term market leaders during their three-five year post-listing growth journey.

The fund's investment universe is restricted to the 100 most-recently listed companies in India. Regulations require at least 80 per cent of the portfolio to remain invested in this universe, while the balance can be allocated to older IPOs that continue to offer attractive growth prospects. Over the last five years, the portfolio has typically held 42-58 stocks.

It builds positions through anchor allocations, during the IPO process, immediately after listing or even several quarters later if valuations become attractive and business execution remains strong.

SCREENING FRAMEWORK

Not every IPO qualifies for investment. The fund excludes SME IPOs, pre-IPO investments, companies with a market capitalisation below ₹1,000 crore and IPOs with issue sizes below ₹500 crore. These filters seek to improve portfolio quality while reducing liquidity risk.

Research begins once a company files its draft red herring prospectus (DRHP). The evaluation process includes management interactions, customer and supplier meetings, plant visits, financial analysis and valuation assessment.

The fund follows a selective approach rather than investing in every IPO. It invested in 55 of

FUND CALL. Edelweiss Recently Listed IPO Fund looks beyond listing gains, aiming to identify newly listed companies with the potential to become long-term market leaders

GETTY IMAGES/STOCKPHOTO

WHY INVEST

- Disciplined selection beyond IPO listing gains
- Selective approach, not every IPO
- Exposure to evolving economic sectors

valuation remains a key consideration, the fund balances it with business quality and long-term growth prospects rather than pursuing low valuations alone.

MID-, SMALL-CAP BIAS

The portfolio has a natural bias

towards mid- and small-cap companies, reflecting the composition of India's IPO market. Over the last five years, the fund's average allocation to large-, mid- and small-cap stocks stood at 12 per cent, 20 per cent and 56 per cent respectively. Most investee companies typically have market capitalisations between ₹5,000 crore and ₹30,000 crore.

PORTFOLIO COMPOSITION

One distinguishing feature of the fund is its exposure to emerging sectors and business models. IPO cycles often mirror the changing structure of the economy. Depending on the listing pipeline, the portfolio may gain exposure to financial services, insurance, defence, pharmaceuticals, contract manufacturing, digital platforms and other fast-growing industries that remain underrepresented in traditional diversified funds.

Sector exposure is capped at 25 per cent. As of May 2026, pharmaceuticals (11 per cent), retailing (9 per cent) and capital markets (9 per cent) were the largest sector exposures. However, the sector mix changes significantly as new companies enter the investable universe and existing holdings are exited based on valuations and business prospects.

A *bl* portfolio analysis of the fund's portfolio since inception shows that investments in Polycab India, Dixon Technologies, Affle 3i, Laurus Labs and IRCTC generated multibagger returns. In contrast, investments in Ellenbarrie Industrial Gases, Shankara Building Products, DAM Capital Advisors, Quess Corp, Spandana

AI trade is losing a key signal

GLOBAL VIEW. The Silicon Data LLM Token Expenditure Index is down almost 20 per cent from a high in May

Bloomberg

At a time when markets are growing uneasy over whether the enormous sums being poured into artificial intelligence (AI) will ever pay off, the prices the sector commands for each unit of usage are drifting lower.

The Silicon Data LLM Token Expenditure Index, which tracks what users pay for AI tokens, is down almost 20 per cent from a high in May after nearly doubling since its inception in December. The gauge is the cleanest read anyone has on the \$700 billion-plus capex boom that has done the sector's heavy lifting.

For stock investors, that could be flashing a warning that AI companies are losing pricing power with increasingly cost-sensitive customers, and that expectations for an eventual AI bonanza could prove misplaced.

"There are increasing reports that users of AI solutions, priced in tokens, are having to restrain unlimited use due to high costs," said veteran investor Louis Navellier. "The chatter that OpenAI is pushing back its IPO to next year is seen as a sign that, currently, profitability remains a problem."

A softer index doesn't mean AI is getting cheaper. The gauge blends prices and usage, meaning a dip can imply very different scenarios: Either list prices are

IMPLICATIONS

A softer index doesn't mean AI is getting cheaper. Either list prices are falling, or demand is shifting toward cheaper models.

falling, or demand is shifting toward cheaper models. It could also point to a genuine softening in what buyers are prepared to shoulder.

WILLINGNESS TO PAY

Each of these possibilities carries different implications. Silicon Data, which built the index, has warned people to stop reading it as a price tag. The firm calls it a proxy for marginal willingness to pay.

Let's start with a benign read: While token prices have collapsed more than 90 per cent since 2023, total spend has roughly doubled since last year. Cheaper tokens have expanded the market. This means that an index pause is simply digestion, while demand is real and capex is money well spent. The bull case for Nvidia Corp., memory makers and data-centre names rests here.

Now for the interpretation that's keeping people up at night: Bears warn that sustained weakness in the index could end the trade that saw nearly the entire AI cohort rally hard this cycle.

GETTY IMAGES

It's token spending that justifies the next capex order, and the bill is already looking stretched. Allianz Research said there's nearly a 46 per cent growth gap between AI investment and sales. That's worse than the 32 per cent divergence measured during the 2001 telecom bust.

POSITIVE RETURN

Fortunately for bulls, the downward trend has paused. It's too early to call a bottom after one flat week, but it's enough to keep the case for a rebound alive. Contracts on the technology-heavy Nasdaq 100 Index

bounced 1.2 per cent on Friday. Cash trading in US stocks is closed for a holiday.

"During the training phase, the cost of AI infrastructure and token generation is extraordinarily high, but in the current inference stage, the economics are significantly better," said David Miller, Senior Portfolio Manager at Catalyst Funds. "The net use of AI delivers a positive return on investment for companies, at least over the long term."

CHEAPER MODELS

Meanwhile, the European Union's AI Act targets frontier models for mandatory evaluations

Sphoorty Financial and FSN E-Commerce Ventures (Nykaa) destroyed investor wealth. This illustrates the fund's high-risk, high-reward nature.

EXIT STRATEGY

Stocks are exited under three broad scenarios: when a better IPO opportunity emerges than the existing stocks; when a company achieves its growth potential earlier than expected and valuations leave limited upside; or when it materially deviates from its IPO strategy or the original investment thesis no longer holds.

PERFORMANCE

The fund has delivered strong long-term performance. Since inception, its five-year rolling return has averaged 18.5 per cent CAGR compared with 17.5 per cent for the Nifty 500 TRI. Rolling returns ranged between 9 per cent and 26 per cent.

On a three-year rolling basis, the fund generated an average CAGR of 19.3 per cent against 17.8 per cent for the Nifty 500 TRI.

The regular plan carries an expense ratio of 1.9 per cent, while the direct plan's expense ratio is 0.83 per cent.

TAKEAWAY

Apart from the Edelweiss' IPO Fund, there are two recently-launched passive funds from Mirae Asset and Motilal Oswal, which track the BSE Select IPO Index. The index retains companies as long as their average market capitalisation remains above that of the 600th stock in the BSE AllCap Index and they have not completed five years in the index. They have a limited track record of around one year.

The Edelweiss Recently Listed IPO Fund offers investors an opportunity to participate in the three-five year post-listing growth phase of newly-listed companies rather than pursuing short-term listing gains. The strategy has the potential to generate outsized returns by identifying future market leaders early in their life cycle.

However, the fund can underperform during market corrections or risk-off phases, as recently-listed companies tend to witness sharper valuation corrections than the broader market. Returns can also suffer when richly-valued IPOs fail to meet growth expectations after listing.

Given its thematic mandate and significant exposure to mid- and small-cap companies, the fund is best suited as a satellite allocation.

Investors looking for dedicated exposure to recently-listed companies can consider the fund through the systematic investment route, with an investment horizon of at least five years.

and stringent transparency requirements. None of these caps prices directly, but does create a deployment-and-compliance burden on top platforms that lesser-but-still-useful systems don't carry. This consideration may just offer companies' financial chiefs a rational reason to route workloads to cheaper models.

To be sure, this isn't a chip-glut call. Top-end graphics processing units and high bandwidth memory are sold out through 2026, with no real relief arriving until 2028. The hardware tell is more subtle in that it points to a demand-mix shifting away from top-end training GPUs, toward inference-optimised parts. This changes the mix of winners, but doesn't hand you a short. The conclusion is that the token chart cuts both ways, and one should hold both reads at once. If the late-June flattening holds and the dip was just mix-shift digestion, cheaper tokens will keep on expanding the markets, meaning capex spending stays justified, leaving the bull case intact.

If instead this is the point where customers' willingness to pay peaks just as regulatory headwinds nudge demand down-market, then the most expensive part of the trade is also the first to crack. That's because it's a pricing-power story, not a silicon story, that is funding the march toward \$1 trillion of capex in 2027.

ALERTS.

ICICI Pru Balanced Hybrid new fund

For investors looking to strike a suitable balance between equity and debt allocation, ICICI Prudential Balanced Hybrid Fund is a new alternative. The fund's balanced approach (equity and debt each receive an allocation of 40-60 per cent) supports both income generation and long-term wealth creation for investors. The new fund offer (NFO) period will close on July 14. On the equity side, the fund will invest across market capitalisations and sectors, while on the debt side it will look for opportunities across duration, AAA/Gsec and credit. The portfolio will be evaluated on a periodic basis, depending on valuations and market conditions, with allocation to equity and debt decided on the basis of earnings and bond yields. Equities have historically generated wealth over the long term, though drawdowns and volatility are inherent to the asset class. Debt, by contrast, tends to deliver more consistent returns over time, providing relatively greater stability than equities. As the two asset classes do not tend to move in lockstep, combining them within a single portfolio can aid in generating a suitable investment experience. Historically, an equity and debt combination portfolio has shown limited downside during equity drawdowns while delivering better returns than debt alone in normal market conditions. No arbitrage is permitted in this scheme. The minimum application amount is ₹500. The scheme will be benchmarked to CRISIL Hybrid 50+50 - Moderate Index. Roshan Chutkey, Manish Banthia and Akhil Kakkar are the fund managers.

Prescription for growth holds

PHARMACEUTICALS. Demand for CDMO favours Divis Laboratories, but valuations remain high

Sai Prabhakar Yadavalli
bl. research bureau

Investor interest in Divis Laboratories continues to be robust on the back of growing demand for Indian CDMO (contract development and manufacturing outsourcing) services. In July 2024, we recommended investors hold the stock, citing healthy growth prospects but high valuations – one-year forward earnings at 55 times then. The company delivered revenue/PAT growth of 13 per cent/17 per cent year on year in FY26, but the stock has gained 49 per cent from the time of the call. With the stock continuing to trade at a premium valuation of 55 times one-year forward earnings (12 per cent premium to the last five-year average), and growth prospects remaining intact, we reiterate the hold call on the stock.

The company operates across Generics (36 per cent of FY26 revenues), Nutraceuticals (9 per cent) and Custom Synthesis (CS) (55 per cent). In the generics segment, the company is a leading producer of around 30 API generics (by volume) and is a world leader in 10 APIs. The nutraceutical division manufactures ingredients for food, dietary and animal feed manufacturers. The CS division designs and develops APIs and advanced ingredients partnering innovators in their development process.

GROWTH OPPORTUNITIES
As shown, the CS segment is expanding significantly, aided by increased interest in Indian CDMO. The company has also reported an increased interest and RFPs from customers in the last couple of years.

The CS segment works on three types of projects. First, it supports innovator projects in Phase-I to Phase-III clinical trials. Second, it supplies APIs and ingredients as an additional source for ongoing innovator development projects. Third, it helps with late life-cycle projects, where an innovator losing

HOLD

Divis Laboratories
₹6,760.55

WHY

- CDMO demand supports strong growth
- Peptides and contrast media offer future potential
- High valuation limits upside

patent protection may need a more efficient manufacturing or synthesis process to support a generic version.

The segment reported 19 per cent CAGR revenue growth in FY23-26, supported by increasing projects on hand. Additionally, the company is likely to add revenues from supplies to commercialised products belonging to clients. Three products have gained commercial scale after the innovators' Phase-III trials. Divis has created dedicated capacities to supply the API and ingredients for the three products and expects commercial supplies from FY28. These are expected to bring in higher volumes at higher realisations/margins and provide 8-10 year revenue visibility, which should further strengthen the division.

Divis has created a Peptide Centre of Excellence under the CS segment, which will be a longer-term growth driver. Peptides are complex chains of amino acids used in biologics (immunotherapy, oncology and diabetes) and are difficult to manufacture. The company has been manufacturing and selling protected amino acids (basic building blocks) and is now moving up the value chain into fragments, which are chains of four-eight amino acids. Some of the fragments are under validation by clients, while a few have been cleared. The clients' clinical trials using the fragments are under studies and also include GLP-1 peptides used in treatment for diabetes. The

company plans to scale up its commercial infrastructure for fragment manufacturing in line with client demand as clinical trials progress over the medium term.

GENERICS, CONTRAST MEDIA
The generics segment has been facing pricing pressure leading to low constant currency growth, but has been aided by the rupee depreciation; it has re-

ported 8 per cent year-on-year growth in FY26. The company expects the pricing pressure to stabilise on an eroded base in the current fiscal. Divis will also add to the portfolio of 30 generic APIs in the short term, depending on patent expiries of the targeted products in the US/EU. The company has commercialised Unit-3 to add capacity and should support the expanded portfolio.

Divis is also eyeing a strong

presence in contrast media APIs. These are products used in the manufacture of injectables that enhance visibility for X-Rays, CT scans and used widely in labs and hospitals. Iodine-based contrast media has been commercialised and Divis is scaling up operations with three leading manufacturers. For Gadolinium-based contrast media products, the company is working with innovators in clinical stages and should see commercialised supplies in the next one-two years.

FINANCIALS, VALUATION
Divis reported 11 per cent CAGR revenue growth in the last three years to ₹10,560 crore. Despite pricing pressure in generics, strong growth in other divisions supported growth. The rupee depreciation in the last one year also helped. The company EBITDA margins have declined from a high of 43 per cent in FY22 to a low of 30 per cent in FY24 and have recovered to 33 per cent in FY26. Loss of the Covid drug portfolio impacted the company in FY22-24, followed by the generic pricing pressure. A strong product mix, led by the CS division, has offset the decline. While EBITDA margins may not rebound to earlier highs, there could be improvement as generic pricing pressure subsides and the current raw material costs (crude derivatives) subside.

The company's growth outlook is supported in the near term by the CS division's commercial supplies, expansion in the generic portfolio and the contrast media segment's scale-up plans. The longer-term drivers are built around the peptide division, where the company has been supplying the base product and has validated (partially) products higher up the value chain. Industry tailwinds from the growing interest in CDMO services continue to support the company. With one-year forward earnings trading at a premium valuation of 55 times, the positives are factored into valuations.

and RevPAR still grew 6 per cent. If international travel or luxury demand weakens, pricing power will be tested and so will be margins.

Second, while the absolute profit numbers improved significantly in FY26, the underlying capital efficiency remains characteristic of a highly asset-heavy luxury hospitality business, with a low asset turnover (0.17x), mid-single-digit RoE (6.2 per cent) and high-single-digit RoCE (8.6 per cent).

Compare Leela to similar-sized and luxury hotel peer EIH, and you will see that the latter displays significantly-stronger capital efficiency metrics for FY26, boasting RoCE of 16.26 per cent, double-digit RoE of 12.15 per cent, and a higher asset turnover of 0.45x. This is important because Leela's pipeline remains partly asset-heavy, with owned projects such as Srinagar, Bandhavgarh, Ayodhya, Agra, Ranthambore and Mumbai BKC.

Third, new growth drivers must deliver. Coorg (ultra-luxury operating resort), Jaisalmer (luxury Desert Resort and Spa), Dubai, luxury residences (new business vertical) and ARQ (luxurious members-only club) can add value, but investors need proof of ramp-up, capex discipline and strong fee income. We are encouraged by The Leela Hyderabad (managed property) that delivered a strong first-year performance.

Undoubtedly, the overall business looks better than at IPO, but the valuation at nearly 21x one-year forward EV/EBITDA still leaves limited room for disappointment.

Importantly, on July 1, 2026, promoter entities of Leela disclosed that they had created a pledge on June 24, 2026 over 18.67-crore Leela shares in favour of Catalyst Trusteeship, acting as onshore security agent for lenders to a \$500-million facility.

The pledged shares represent 55.91 per cent of Leela's equity and 73.67 per cent of promoter holding. This is not a direct balance-sheet liability for Leela, as the stated use of funds is promoter-level distributions, repayment of promoter shareholder loans etc. Still, given the size of the encumbrance, it can remain a stock overhang, especially if promoter-level stress or a sharp fall in Leela's share price raises invocation concerns.

Kumar Shankar Roy
bl. research bureau

When Brookfield-backed luxury hotel chain Schloss Bangalore, now called Leela Palaces Hotels & Resorts, came out with its IPO in May 2025, our view was cautious. The ₹3,500-crore issue offered exposure to a strong luxury hospitality brand, but the investment case had gaps such as high debt, thin reported profit, low capital efficiency and limited margin of safety. That call was not against The Leela brand. It was against the price investors were being asked to pay at that stage. Based on FY25 EBITDA of ₹700 crore, Schloss was being offered at an EV/EBITDA of 23 times the IPO price of ₹435/share.

About a year later, the stock deserves a fresh look. At ₹477/share, it is about 9 per cent above the IPO rate (listed top 3 peers are down about 12 per cent since Leela's listing on June 2, 2025).

The business has also delivered a sharper FY26 than what the IPO numbers suggested. Profit after tax rose to over ₹400 crore (vs ₹48 crore in FY25), thanks to IPO-led debt reduction, lower finance costs, stronger operating leverage and double-digit RevPAR-led revenue growth. Net debt/adjusted EBITDA reduced to 2x from 6.5x (using Bloomberg data).

Still, at one-year forward EV/EBITDA of 21x based on consensus estimates, the stock is not cheap if we look at Indian Hotels (28x FY27e EV/EBITDA), ITC Hotels (22x) and Oberoi-owner EIH (17x). Leela's brand strength, pricing power, deleveraged balance sheet and high margins support the valuation.

However, limited listed history, asset-heavy expansion, modest return ratios and margin sustainability risks justify a 'hold/neutral' currently.

BUSINESS

Since Brookfield acquired The Leela hotels from debt-ridden Hotel Leelaventure (HLV) in 2019, the brand has maintained its stature in Indian luxury hospitality. Leela Palaces Hotels & Resorts is a pure-play luxury hospitality company with a portfolio across owned hotels (higher revenue, higher capital) and managed hotels (lower cap-

HOSPITALITY IPO concerns have eased, but the re-rating case for Leela Palaces Hotels still needs stronger evidence

ital, lower fee income). The company now has 15 operational hotels with 4,162 keys and a pipeline of nine hotels with 1,065 keys in the next five years (26 per cent capacity addition). About one-fourth of new rooms/keys will be under managed model.

The operating performance is strong. For example, for the five owned palaces, FY26 RevPAR rose 14 per cent to ₹17,460. RevPAR combines room rates and occupancy. ADR, or average daily rate, rose 13 per cent to ₹25,375, while occupancy increased only 1 percentage point to 69 per cent.

This tells us growth came mainly from pricing. In city hotels, RevPAR in FY26 grew 13 per cent to 16,321 on the back of flat growth in occupancy at 72

per cent, while in resort hotels the metric zoomed 17 per cent on the back of 6 percentage point rise in occupancy at 59 per cent.

The company also has a meaningful food and beverage (F&B) engine. F&B revenue rose 15 per cent, and the F&B-to-room revenue ratio improved to 71.2 per cent.

WHAT HAS CHANGED

During the time of IPO, the company had said it will use ₹2,300 crore from the IPO proceeds to repay or prepay borrowings. Consequently, debt fell from ₹4,141 crore in 2025 to ₹1,810 crore in 2026, per Bloomberg. This directly addresses one of the main IPO concerns that the earlier debt burden was too high for com-

fort. The second change is profit visibility. FY26 revenue (adjusted) grew about 20 per cent to ₹1,527 crore. Adjusted EBITDA grew 26 per cent, while margin improved to nearly 49 per cent. Importantly, reported finance cost fell 56 per cent.

While the business has improved, the PAT jump is not purely operational. Net-net, debt and profitability concerns have reduced. Capital efficiency and valuation comfort still need more comfort.

WHAT NEEDS TO CHANGE

For the stock to move from 'hold' to a stronger positive call, three things need to become clearer.

First, EBITDA margins must prove sustainable at 48-50 per cent levels. Q4 showed the risk. Occupancy fell from 78 per cent to 72 per cent due to war impact, though ADR rose 15 per cent

businessline's editorial policy prohibits analysts from taking positions in the stocks they recommend — Editor

WHO AM I?.

Are you an avid investor? How well do you know corporate India?

Here's a challenge. Using the five clues below, identify the company that is being talked about here

- I was founded more than 40 years ago by three promoters, one of which is a listed company in India with multi-billion-dollar market capitalisation. I am their first JV in India.
- I am one of the few companies to have someone serve as MD for 35 continuous years. He is a Wharton graduate, as is his daughter, who also serves on my board.
- I have more than half the market share in India and my parent, whose brand I share, commands double-digit market share globally.
- Despite my largest customer being one of my promoters, I have had a healthy return on equity of over 15 per cent for the last 10 years, and net profits too have grown at that rate.
- While my stock price halved in the two years prior to Covid, it has grown more than five times since then, averaging more than 18 per cent per annum return to shareholders over the last 10 years.

Send your answers by Wednesday 6 p.m. to who-am-i@thehindu.co.in, with your full name, postal address and phone number. A lucky winner in each week will get a book sponsored by UNIFI Capital as a reward.

Nifty 50 (24,271) gained 0.9 per cent over the past week, while Nifty Bank (57,939) slipped 0.4 per cent, reflecting a divergence. The derivatives data suggests that Nifty's up move is finding support from fresh long additions in the July series, whereas Bank Nifty appears to be undergoing a phase of consolidation after its recent outperformance.

FII's (Foreign Institutional Investors) remained net short on index futures, with the position widening 12 per cent over the last week to 2.51 lakh contracts. However, their positioning in the options segment turned less defensive. Net short positions on index call options declined 10 per cent to 2.33 lakh contracts, while net long positions in index puts fell 20 per cent to 4.77 lakh contracts. This indicates that although foreign investors continue to retain a bearish bias through futures, they have reduced some downside hedges.

The broader positioning remained mixed. Combined net short positions on index futures increased from 72,767 contracts to 78,070 contracts. At the same time, net short positions on call options increased from 1.20 lakh contracts to 1.44 lakh contracts, while net put shorts increased marginally from 1.34 lakh contracts to 1.36 lakh contracts. Taken together, the options data suggests that traders have become less aggressive in betting against the market despite the rise in futures shorts.

The derivatives data broadly mirrors the price action. Nifty extended its recovery and saw fresh long additions in the July futures series, whereas Bank Nifty witnessed mild profit-taking after a strong rally over the previous weeks. Overall, the data points to a positive undertone for Nifty, while Bank Nifty appears to be consolidating

within an ongoing positive trend.

NIFTY 50
Nifty futures (Jul) (24,353) witnessed some weakness in the early part of last week but recovered strongly thereafter. On Friday, the contract opened above the resistance at 24,300 and managed to close the week above this level, a positive technical signal.

The bullish outlook is supported by fresh long additions in the July series. While Nifty futures gained 0.8 per cent over the week, its open interest (OI) surged from 92 lakh contracts to 171 lakh contracts, indicating fresh buying interest.

The options data also points to a positive bias. The Put Call Ratio (PCR) of July options stood at 1.14 on Friday. A PCR above 1 suggests that put writing continues to outpace call writing, reflecting positive sentiment among option traders.

Taken together, the derivatives

CONSTRUCTIVE TONE

- Nifty futures closes above a barrier
- Support holds for Nifty Bank futures
- Upside targets remain valid

data indicates potential for further upside in Nifty futures (Jul). Although the contract could witness a brief corrective decline towards the 24,250-24,300 support zone, it is likely to attract buying interest there and eventually move up to 24,750 in the near term.

On the downside, a break below 24,250 can drag the contract to the 24,000-23,900 support band. A breach of this zone would weaken the near-term outlook and potentially shift the bias in favour of the bears.

Overall, the trend remains bullish and any corrective dip can

be viewed as a buying opportunity.

Strategy: Last week, we recommended buying Nifty futures (Jul) on a breakout above 24,300. Traders can continue to hold the position with the stop-loss at 23,900. When the contract rises to 24,600, revise the stop-loss to 24,500. Book profits at 24,700.

NIFTY BANK
Nifty Bank futures (Jul) (58,221) largely traded sideways through last week and ended the period with a loss of 0.7 per cent. The decline was accompanied by an increase in OI from 12.6 lakh contracts to 22.4 lakh contracts, indicating fresh short build-up.

That said, the options data paints a relatively less bearish picture. The PCR of July options improved from 0.79 to 0.85 over the week, suggesting that put writing outpaced call writing during the period.

The broader trend on the chart continues to remain positive. Key supports for Nifty Bank futures (Jul) are placed at 57,550 and 57,000. Notably, the 21-day moving average is currently positioned at 57,250, creating a strong support cluster in the 57,000-57,550 region. We expect the support at 57,550 to hold and therefore consider the probability of a sustained decline below this level to be low.

Consequently, Nifty Bank futures (Jul) is likely to resume its uptrend either from the current level or after a brief dip towards 57,550. Such a move can take the contract to 60,000, a key resistance.

On the other hand, if the contract slips below the support at 57,000, the correction can deepen towards 56,000. Support below this level is at 55,000.

Strategy: Last week, we recommended buying Nifty Bank futures (Jul) at 58,250. Traders can continue to hold this position with the stop-loss at 57,400. Book profits at 60,000.

Cumulative Open Interest (Futures)

Open Interest chain (as on July 3)

Put-Call ratio Nifty **1.14** | Nifty Bank **0.85**

Change in Open Interest (OI)

F&O Strategy

Buy Asian Paints futures

KS Badri Narayanan

The stock of Asian Paints (₹2,737.80) is crucially placed and has been moving sideways, trying to find direction. Immediate support levels are ₹2,635 and ₹2,430. A close below the latter will change the short-term outlook negative and can take the stock to ₹2,270.

Immediate resistance is at ₹2,874 and a close above this will trigger a rally that could lift stock above ₹3,000. We expect the rally to continue in the short-term as Asian Paints will announce Q1 FY27 financial results on July 29.

F&O pointers: Asian Paints July futures closed at ₹2,744 against the spot price of ₹2,737.80. The premium indicates a build-up of long positions. The July futures saw a strong build-up from 8 lakh shares on June 23 to over 86 lakh shares now, as traders preferred long rollovers. Option trading indicates that Asian Paints could move in the ₹2,480-2,600 range.

Strategy: Buy Asian Paints futures while keeping initial stop-loss at ₹2,720. Shift stop-loss to ₹2,740 if the stock opens on positive note and stays firm in Monday's early trade. Target can be ₹2,800.

This strategy is strictly for traders with high risk tolerance and are comfortable in meeting the margin commitments for futures. Traders should also bear in mind that Asian Paints is a high beta stock, indicating higher risk. We advise traders to stay away from this strategy if Asian Paints opens below ₹2,700 or above ₹2,755.

Follow-up: Ashok Leyland hit the mentioned targets.

Note: The recommendations are based on technical analysis and F&O positions. There is a risk of loss in trading.

Short Take

Understanding futures rollover

bl. research bureau

Rollover in futures means closing out the nearest expiry contract and initiating a similar position in the next month contract.

Rollover percentage is calculated by adding the mid and far month outstanding open interests, dividing it by the sum of current, mid, and

far month outstanding open interests and multiplying by 100. For instance, you hold a long position in July expiry Nifty 50 futures and on expiry day (on July 28) you expect the futures to rally further. To capitalise on this, you can liquidate the current month contract, which is the July series, and create a fresh long position in August or even September series.

Similarly, if you have short and you forecast the contract to weaken further, you can exit from current month contract and enter next month contract.

Rollover percentage is important as it can indicate the strength of the prevailing trend. If the rollover from the previous month to the current month is 70 per cent and the rollover from the current month to next month goes up to 80 per cent, and the futures price has been steadily increasing, this is a bullish indication. That said, the rollover percentage alone cannot be relied on, but it should be seen in conjunction with the price movement.

Pin risk: What we must know

MASTERING DERIVATIVES. It is good to sell the option before expiry to get back some time value

Venkatesh Bangaruswamy

With effect from August 3, NSE will implement a closing auction session (CAS) to determine closing prices of stocks on which futures and options are available. Currently, NSE determines closing prices of all stocks using the last 30 minutes average price. Experts have discussed various benefits about the NSE switching to CAS. This week, we look at one such benefit – pin risk.

RISK FACTOR

You will be exposed to pin risk if you hold the option till expiry

ful to sell the option before expiry; you can get back some time value.

Now, you will be exposed to pin risk if you hold the option till expiry. This is the risk that the option is out-of-the-money (OTM) on the day of expiry but becomes in-the-money (ITM) at the close of the day. This is a risk

because long ITM option position requires you to take delivery of the underlying shares. To understand this risk, suppose you setup a tight bull call spread on a stock – long the 760 call and short the 780 call. At expiry, suppose the stock closes at 779.50. The 760 call expires ITM whereas the 780 is out-of-the-money (OTM). You are aware of the closing price of the underlying only after the market closes, as the price is determined based on the average of the last 30 minutes. So, you must pay for delivery of shares attached to the

760 long call. If the stock's closing price had been a rupee more, you will be required to take delivery for the 760 long call and give delivery for the 780 short call. The delivery requirement will be matched against each other.

NSE is set to extend trading hours on the F&O segment by 10 minutes from August 3. So, you will know the closing price of an underlying by 3.35 pm and decide whether to close your options position before the F&O segment closes at 3.40 pm or exercise your right. That will help in managing pin risk.

OPTIONAL READING

If you close your position before expiry, you will not face pin risk. The issue is that you may be closing your position when the option is still OTM. That means your gains, if any, will be lower. Note that all ITM long positions on equity result in delivery whereas index options are cash settled. This means you can avoid pin risk by trading Nifty Index options.

Barriers ahead

BULLION CUES. Traders can exit the longs

Akhil Nallamuthu
bl. research bureau

revise the stop-loss up to ₹1,45,000. Also, since there are resistances ahead, we suggest exiting at ₹1,49,000.

MCX-Silver (₹2,37,410)
Silver futures (Sep) outperformed gold futures last week. But it is now hovering around a notable hurdle at ₹2,40,000.

If the contract starts to fall again on the back of the resistance, it can slide to ₹2,15,000.

In case the resistance at ₹2,40,000 is breached, silver futures can rally to ₹2,53,000.

Trade strategy: Last week, we recommended buying silver futures at ₹2,23,400 with a stop-loss at ₹2,12,400 for a target of ₹2,40,000. Since the contract is facing a resistance ahead, exit at ₹2,37,410.

Forms a base

CRUDE CHECK. Traders can consider longs

Akhil Nallamuthu
bl. research bureau

After facing a sharp sell-off in the recent weeks, crude oil prices stabilised last week. Brent crude oil futures on the Intercontinental Exchange (ICE) (\$72.10/barrel) and crude oil futures in the domestic market (₹6,568/barrel) posted modest losses of 0.7 per cent and 0.1 per cent respectively.

BRENT FUTURES (\$72.10)
Brent crude futures dropped to a five-month low of \$70.14 on Thursday. However, the fall was a measured one and the movement over the past week shows that the bears have lost momentum. The support at \$71 is helping Brent crude futures in the fight against the sell-off.

While we may not witness a bullish reversal in trend, we are likely to see a corrective rally. The uptick can lift the contract to \$80. A breakout of \$80 can lift the contract to \$86. However, if the contract breaches the support at \$71, the downtrend can extend to \$65.

MCX Crude Oil (₹6,568)
Crude oil futures (July), which has been in a downtrend, found support at ₹6,400. While there was no recovery last week, the contract largely stayed sideways.

Since the Brent crude futures is hovering near a considerable support and is likely to rebound, the crude oil futures in the domestic market too can rise.

The upswing can take the contract to ₹7,300.

But if crude oil futures slips below the support at ₹6,400, it can lead to another downswing, possibly dragging the price to ₹5,800.

Trade strategy: Last week, we recommended buying crude oil futures at ₹6,577. Retain this position and maintain stop-loss at ₹6,350. Book profits at ₹7,200.

Nifty 50 and Sensex have risen breaking above their intermediate resistance in line with our expectation. That keeps our overall bullish view intact. Both the indices were up about 0.9 per cent each last week. An inverted head and shoulder pattern is being formed on the daily chart. That strengthens the bullish case for both the Sensex and Nifty to go much higher in the coming weeks.

Nifty Bank index on the other hand has been stuck inside a narrow range for the third consecutive week. The index fell within the range and was down 0.4 per cent for the week. The bias is positive. So, we can expect the Nifty Bank index to make a bullish breakout of this range going forward.

Among the sectors, the BSE Realty index surged the most last week. The index rose 7.8 per cent.

PPIS BUY

The Foreign Portfolio Investors (FPIs) were net buyers of Indian equities for the third consecutive week. They bought about \$463 million last week. If the FPIs accelerate their purchase in the coming weeks, then that can aid the Sensex and Nifty to go higher. We will have to wait and watch.

NIFTY 50 (24,270.85)

Short-term view: As expected, Nifty has risen breaking above the resistance at 24,200. The rise last week also confirms a bullish inverted head and shoulder pattern on the daily chart. Supports are at 24,200, 24,000 and 23,900.

Nifty can rise to 24,750-24,800 from here. The target for the inverted head and shoulder pattern is coming around 25,300. Nifty has to decline below 23,900 to turn the near-term picture negative. If that happens, a fall to 23,600 can be seen. But that looks less likely.

Medium-term view: Nifty is moving up well within its broad 22,000-26,500 range. We can expect it to test the upper end of this range in a couple of months.

The bias remains positive. As such Nifty can make a bullish breakout above 26,500 and rally to 28,000 and even 30,000 in the long term.

Nifty has to decline below 22,000 to prove this bullish view wrong and turn the outlook bearish.

MOVERS & SHAKERS

AKHIL NALLAMUTHU, bl. research bureau

Coforge (₹1,463.70)

Breakout sustains

Ever since falling to a two-year low of ₹1,008.50 on March 17, the stock of Coforge has been appreciating. In mid-May, it breached a barrier at ₹1,365. While there has not been a strong rally post the breakout, the chart shows that ₹1,365 has been acting a good base and holding up well. Going ahead, we expect the stock to gather strength and break out of ₹1,525. This can intensify the rally, taking it to ₹1,800. Traders can buy now at ₹1,463 and ₹1,400. Place a stop-loss at ₹1,320. When the price touches ₹1,600, revise the stop-loss to ₹1,485. Tighten the stop-loss further to ₹1,650 when the stock appreciates to ₹1,700. Book profits at ₹1,800.

Delhivery (₹507.40)

Hits four-year high

The stock of Delhivery rallied 9.2 per cent last week and hit a four-year high of ₹515 before closing at ₹507.40. It broke out of a key resistance at ₹485, sending a strong hint that more upside is in the cards. That said, from the current level, the stock can see a decline following the breakout, to retest the support levels at ₹485 and ₹460. Post this likely decline, we anticipate a fresh leg of rally, which can lift the stock to ₹700 in the medium-term. Hence, participants can go long now at ₹507 and buy more shares at ₹470. Keep stop-loss at ₹415. On a rally to ₹570 and ₹620, alter the stop-loss to ₹520 and ₹590 respectively. Book profits at ₹700.

Max Healthcare (₹1,153.15)

Resumes the uptrend

The stock of Max Healthcare has been on a decline over the last one year. However, the price action since February shows that it formed a good base ₹930. Capitalising on this, the bulls have been pushing the price up recently. As a breakthrough, the rally took the stock above the resistance at ₹1,100, indicating that the uptrend has resumed after a period of downtrend. We expect the stock to surpass the prior high of ₹1,314.30 and touch ₹1,500 in the coming months. So, buy now at ₹1,153 and accumulate at ₹1,060. Place initial stop-loss at ₹880. When the price touches ₹1,300 and ₹1,400, revise stop-loss to ₹1,220 and ₹1,350 respectively. Exit at ₹1,500.

NIFTY BANK (57,938.50)

Short-term view: Nifty Bank index is stuck in a narrow range for the third consecutive week. The immediate picture is unclear. The index can oscillate between 56,800 and 58,800 for some more time.

But eventually we expect the index to make a bullish breakout above 58,800. Such a break can take the Nifty Bank index higher to 60,500 and 61,500 in the short term.

In case the index breaks the range below 56,800, the near-term picture will turn negative. In such a scenario, there are good chances to see a fall to 56,000 or even lower. But our

preference is to see a bullish breakout above 58,800.

Medium-term outlook: There is no change in the broader bullish outlook. Key resistance is in the 61,000-61,500 region. A break above 61,500 will be bullish to see a rise to 65,000 in the medium term. It will also boost the momentum for a fresh rally to 68,000-69,000 in the long term.

As mentioned last week, 53,500 and 50,000 are important support. Nifty Bank index has to fall below 50,000 to negate the above-mentioned bullish view.

SENSEX (77,763.91)

The resistance at 77,400 has

SHORT-TERM TARGETS

- Nifty 50: 24,750-24,800
- Sensex: 81,000-81,500
- Nifty Bank: 60,500-61,500

been broken as expected. That keeps intact our bullish view of seeing 78,800-79,000 on the upside. Like Nifty, there is an inverted head and shoulder pattern visible in Sensex as well. A strong rise above 79,000 will confirm this pattern. It will then strengthen the bullish case for the Sensex to target 81,000-81,500 eventually in the coming weeks.

Supports are at 77,400, 76,700 and then in the 76,300-76,000. Sensex has to decline below 76,000 to turn the short-term outlook bearish. Only then a fall to 74,000-73,000 will come back into the picture.

Medium-term view: The broader 71,000-86,000 range is intact. Within this, Sensex is expected to move up towards 86,000, the upper end of the range. A decisive break above 81,500 can clear the way for this rise in the medium term.

The long-term outlook is also bullish. So, eventually we can expect the Sensex to breach

86,000. Such a break can take the index higher to 90,000 and even 94,000 over the long term.

NIFTY MIDCAP 150

(22,884.35)

The index has risen back well from the low of 22,539. Supports are at 22,750 and 22,600. Resistance is in the 23,200-23,300 region which can be tested in the short term.

We retain our bullish bias of getting a breakout above 23,300 eventually. That in turn can boost the bullish momentum. A fresh rally to 26,000-26,500 can be seen thereafter in the medium term.

It will also increase the chances of seeing 28,000-28,500 on the upside in the long term.

Nifty Midcap 150 index has to decline below 22,600 to turn the short-term picture negative. If that happens, a fall to 22,000 will come into picture.

From a long-term perspective, 21,000-20,800 is a crucial support. The index has to decline below 20,800 to turn the outlook bearish.

NIFTY SMALLCAP 250

(17,996.25)

The support at 17,550 mentioned last week has held very well as expected. The Nifty Smallcap 250 index touched a low of 17,544 and has reversed higher from there. The index can rise to test the crucial resistance level of 18,300.

We expect the index to breach 18,300 decisively. Such a break can strengthen the bullish momentum and take the Nifty Smallcap 250 index higher to 22,500-23,000 in the medium term. It will also keep the upside open to target 24,000-25,000 in the long term.

Failure to breach 18,300 can keep the index in a narrow range of 17,500 and 18,300 for some time. The short-term outlook will turn negative only if the index declines below 17,500. In that case, a fall to 17,000 or even 16,500-16,300 can be seen.

Watch **bl. Guru** share the Nifty and Bank Nifty technical outlook for this week

Crucial juncture

US MARKET OUTLOOK. The Dow Jones close to an important resistance

Gurumurthy K

bl. research bureau

The Dow Jones Industrial Average, S&P 500 and the NASDAQ Composite Index have risen well last week. The Dow Jones has come close to its crucial resistance. The recovery in the S&P 500 and NASDAQ Composite looks shallow. Broadly, we prefer to remain cautious rather than being overly bullish on the US equities at the moment.

Here is an analysis on how the US markets can perform in the coming week.

DOW JONES (52,900.07)

The Dow Jones surged to a record high of 52,903.85 last week and has closed on a strong note. However, a crucial resistance is at 53,150 which will need a close watch this week. Failure to breach this hurdle and a subsequent fall below 52,000 will be bearish. That in turn will indicate a top in place. In that case, the Dow Jones can fall back to 50,000-49,000 in the coming weeks.

A sustained rise above 53,150 is needed to keep the upmove going. If that happens, then a rise to 55,000 is possible.

We prefer to remain cautious rather than being overly bullish at the moment.

S&P 500 (7,483.25)

The S&P 500 index has risen back well and recovered almost all the loss made in the previous week. But the price action indicates the absence of strong buyers above 7,500. So, we will have to wait and watch the movement for a few days to get clarity.

Even if the index goes above 7,500, it has to breach 7,600 decisively to gain bullish momentum. Only then a rise to 7,800 will come into the picture.

As long as the index remains below 7,600, we retain our view of seeing a fall to 7,200-7,150 in the coming weeks. A break below 7,300 can trigger this fall.

SUPPORTS AHEAD

The dollar index has good supports at 100.60 and 100.40 from where it can bounce back again and keep the uptrend intact.

NASDAQ COMPOSITE

(25,832.67)

The resistance at 26,250 mentioned last week has held very well. The NADAQ Composite index touched a high of 26,261 and has come down from there. Near-term support is at 25,600. A break below it can drag the index down to 25,000 again. It will also keep the downside open to see 24,200-24,000 eventually in the coming weeks.

NASDAQ Composite index has to rise past 26,250 in order to get some breather. Only then a rise to 27,000-27,500 is possible.

DOLLAR INDEX

The dollar index (100.88) has declined below 101 towards the end of the week. The jobs data release on Thursday showed that the unemployment rate in the US dipped to 4.2 per cent in June from 4.3 per cent a month ago.

Valueuation Radar: The Good, The Bad, The Ugly

The benchmark indices, Sensex and Nifty 50, rose 0.9 per cent each last week. BSE Realty and BSE Healthcare led the gains, rising 7.8 per cent and 3.1 per cent, respectively, while BSE Capital Goods and BSE Power lagged, returning -2.7 per cent and -2.6 per cent, respectively

The sector indices are disseminated by S&P BSE.

Home purchase is an important life event. So much so that, just as one insures health, life and motor vehicles, a home purchase should trigger an almost immediate purchase of term insurance for financial protection. But there are two ways in which this can be achieved: home loan term insurance or simple term insurance.

We detail the difference between the two and show why simple term insurance should be a preferred insurance option.

HOME LOAN INSURANCE
Home loan insurance is a product that covers the liability to the bank from a home loan and is not a mandatory product but an option presented to the home loan customer.

After one gets approval for a home loan from any bank, most likely, the sales officer or a third-party agent would follow up with this question: “Would you be interested in a home loan insurance as well?”

The sales officer would go on to explain the product, the pricing, its features and also mention that the premium amount can be added to the outstanding loan and repaid as one repays the loan.

An unsuspecting homeowner in the heat of the moment, and who until then has been transacting in lakhs or crores, would not pay much heed to the additional ₹1 lakh or so piled on to the home loan.

This is especially considering the protection it offers the family. But to understand why better options exist, one must understand the product as well, beyond mere pricing comparison.

As the name indicates, this is an insurance to cover the home loan liability to the bank. Under an adverse eventuality, the insurer would pay the bank the outstanding loan amount. This would clear the surviving family of the loan liability, and the insurance as well as the home loan would be closed.

It is clear that while the homeowner pays insurance premiums (which are comparatively higher) to protect the asset, the bank gets the benefit of hassle-free liability clearance while not sharing the cost of premiums.

The bank also benefits from the higher loan outstanding (in-

A better safety net for home buyers

TAKING COVER. Here are reasons why a term policy paired with a home loan is better than taking home loan insurance

clusive of the home loan insurance premium) on which it earns an interest as well.

During the home loan repayment, it is possible that the homeowner can shop around for banks and secure even more favourable terms from another bank. If the loan is transferred, the loan insurance is nullified and not ported to the new bank, nullifying the premiums paid to date.

While home loan insurance does protect the nominee, simple term insurance can offer much more.

TERM INSURANCE
The first difference is in pricing. Considering a sum assured of ₹1 crore for a 35-year-old, a term insurance would cost around ₹8,000-9,000 per year.

If a policy period of 20 years is

- WHY**
- Home loan insurance is not mandatory
 - Home loan insurance costs 10-20% more
 - Term insurance gives families better control

considered, the single premium would cost ₹80,000-90,000 if discounted to the current day at 8 per cent discount rate.

A home loan term insurance offered by the bank or a third party would cost 10-20 per cent more at ₹1 lakh-1.2 lakh. The factors of age, place of residence, lifestyle habits, medical conditions can influence the price as well.

Also, principal is repaid in

home loans, slowly at first and significantly in later years. For an average home loan, despite a 20-year period of repayment, it would not be unusual to be repaid in 8-10 years.

In such cases the price difference is even starker. While a term insurance continues to deliver ₹1 crore sum assured consistently, a home loan term insurance covers the bank liability which is decreasing and may not exist in 8-10 years and does so at 10-20 per cent higher cost of premium.

But the primary difference is in cash flow. In the case of death of the homeowner, a term insurance delivers the full sum assured to the nominee or family. This allows for the nominee to plan for loan repayment, full or partial, and still have funds in hand – depending on the sum as-

sured and loan repaid to date.

In the more likely scenario of repaying the home loan, the term insurance can still be retained.

The human life value (value of future earnings potential that is to be covered in term insurance) would have expanded significantly in the period the home loan was repaid and the term insurance originally intended for the home loan can continue to cover the increased human life value, but purchased earlier and so is cheaper.

The difference between the two is essentially a difference between insuring the liability or creating a cashflow based on adverse eventuality that can be used at discretion.

The better option would be a term insurance which offers better control to the family.

INSURANCE QUERY.

SANTOSH CHACKO

I'm a 35-year-old salaried professional with a spouse, young child, home loan and basic employer-provided life cover. While buying a personal term insurance plan, I'm confused whether to choose a level cover, step-up/increasing cover option, or add riders like critical illness and waiver of premium to match future responsibilities such as inflation, children's education and outstanding loans. How should one evaluate these features without overpaying? Also, how important are medical disclosures, nominee details and income documentation at the proposal stage, and what are the common mistakes that later lead to claim disputes or delays despite high claim settlement ratios?

Bhaskar

At the age of 35, financial responsibilities often start becoming more layered, especially with commitments such as a home loan, children's future expenses, and long-term family security. In such situations, term insurance should be viewed as a financial safety net that supports your family's financial

continuity in your absence, rather than just another financial product.

UNDERSTANDING YOUR COVERAGE NEEDS
Employer-provided life cover is a useful starting point, but in most cases, it may not be sufficient as a standalone protection plan. Since such coverage is linked to employment, it may not continue during a job change, career break, or retirement. A personal term insurance plan helps create an independent and long-term protection layer for your family.

When deciding the cover amount, it is important to look beyond current income levels. Factors such as outstanding loans, future education expenses for children, household living costs, inflation, and the number of years your family may continue to depend on your income should all be considered. Existing investments and savings can support long-term goals, but they may not always be immediately available or adequate during a contingency

LEVEL COVER VS INCREASING COVER

A level cover plan provides a fixed sum assured throughout the policy term and is generally suitable for individuals who already have a reasonably adequate cover amount in mind. An increased or step-up cover option may be useful as your responsibilities and income are expected to rise over time. These plans are

GETTY IMAGES/ISTOCKPHOTO

designed to gradually increase the cover amount to help account for rising costs linked to inflation and future family needs.

Instead of selecting every available feature, you should focus on choosing benefits that genuinely align with your life stage and financial priorities. The choice should depend on affordability, financial responsibilities, and long-term sustainability of premiums.

SHOULD YOU ADD RIDERS?
Riders such as critical illness or waiver of premium can provide additional support

during difficult circumstances. For example, a waiver of premium rider can help continue the policy in case the policyholder is unable to pay premiums due to a serious illness or disability. Similarly, a critical illness rider may help manage large medical expenses.

However, riders should be evaluated carefully based on individual needs, family medical history, and affordability, rather than being added automatically.

WHY DISCLOSURES MATTER
One of the most important aspects of buying term insurance is accurate disclosure at the proposal stage. Details related to medical history, smoking or alcohol habits, occupation, existing insurance policies, and income should always be declared honestly, even if they appear minor.

Many claim-related disputes arise due to incomplete or inaccurate information shared during policy purchase. Nominee details should also be updated periodically to reflect current family circumstances. In addition, policyholders should ensure timely premium payments and keep family members informed about policy documents and insurer details.

Ultimately, a term insurance plan works best when it combines adequate financial protection with transparency and long-term discipline.

PNB Gilts' 30 years in Indian debt market

PNB Gilts, a standalone primary dealer and subsidiary of Punjab National Bank, celebrated its 30th Foundation Day, commemorating three decades of contribution to the development of India's debt market and the government securities (G-Secs) ecosystem. Established in 1996, PNB Gilts has played a pivotal role in strengthening India's fixed income market through its expertise in G-Secs, treasury solutions, market making, underwriting and debt capital market services.

AU SFB partners with Maruti Suzuki

AU Small Finance Bank (AU SFB) said it has entered into a strategic partnership with Maruti Suzuki India Limited to launch an industry-first initiative, “Suhana Safar” - a Recurring Deposit (RD)-backed auto loan scheme designed to make car ownership more accessible for aspiring first-time buyers of the most popular models; Alto K10, S-Presso, Celerio, and WagonR. Under the scheme, a customer opens a RD account with AU SFB and deposits a fixed monthly amount, which on maturity, is utilised as the down payment, following which, Bank sanctions the loan.
